

Energy Initiator[®]

Purpose built software that identifies up to 50% more energy saving opportunities.

Our industry knowledge and our innovative approach to meeting clients' needs has led us to develop two unique tools, **Energy Initiator[®]** and **Energy Activator[®]**. Both of these tools have been specifically designed to meet the energy efficiency challenges of manufacturing industries.

Energy Initiator[®] is a software tool designed to help systematically survey industry infrastructure and process machinery to provide an intimate understanding of how and where energy is currently being used throughout a site or business, and more importantly how and where energy consumption may be reduced.

How does it work?

The software is used in conjunction with other appropriate survey tools and uses a comprehensive suite of questions relevant to the subject of the survey i.e. a building, process or individual asset with accompanying scores and guidance notes. This enables a comparison to be made between the current energy performance and the potential energy performance of the asset, process or building using an A-G rating. Details of the identified improvement opportunities together with their impacts upon costs, energy and emissions are key outputs of **Energy Initiator[®]**.

Energy Initiator in use on site

The benefits:

- Reduces average survey time by 30%
- Increases number of energy improvement opportunities identified by 50%
- Provides an intimate knowledge of how and where energy is being used and wasted
- A-G certification of individual assets, processes, buildings or sites shows current and potential
- Provides hitherto unavailable information to help reduce energy by as much as 41%
- Captures photos and sketches relevant to the survey
- Seamless interface with project management tool, **Energy Activator[®]**

Energy Initiator is for use, following training, by qualified energy professionals and is available under licence.
